10                                ABSTRACT

        Methods and apparatus are provided for converting binary image data at a

first resolution to binary image data at a second resolution, the methods including

detecting the edges of the binary image data, sampling a corresponding point on or

15    substantially near each of the edges, fitting a curve between the sampled points, and re-

sampling the curve at the second resolution.
